

## Monoclonal Cells

To create newer monoclonal cells to save human lives here we are!  
Together shall we not strive for success with diligence and care?  
We wish to set out promises of better lives to many dyeing in despair  
Time's running out and a single effective one shall signal hopes far and near!

The path is not smooth and we may not always be comfortable  
As there are no road maps or clues that we can walk with ease and well!  
But we shall create paths and roads as we toil and our desires swell,  
For, only dedicated work shall unveil the path for the story we would like to tell.

Monoclonal cells are tiny living entities that produce proteins of precise nature  
And the proteins that would be available from one complex creature  
Would roam and ride on structures of cell –surface receptors  
To modulate signals of evil nature and to save lives of the diseased possessors.

Even if we have planted one and only one tree in a barren land,  
And have nurtured with care to make it survive, grow and expand,  
We have made a beginning in the land of rocky and barren sand,  
To create Plazas of thriving lives in places of no hopes, into a wonderland!
